Disclosure; Fig 1; 24pp; English.

This Bak protein sequence represents a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1 protein, and is capable of modulating apoptosis. The protein may brotein, in a new virucide drug screening method, which involves combination of Bak protein and a viral protein (e.g. EBV BHRF1).

Exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak and viral proteins allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or diagnostic agents. Compounds which Human; Bak; apoptosis; latency; virus replication; Epstein-Barr virus; BHRF1; fusion protein; epitope tag; drug screening; co-precipitation; ELISA; immunoassay; antibody; protein interactive trapping; virucide; antitumour; diagnostic. Screening for anti-viral agents - by detecting the ability of agent to disrupt the interaction of a Bak protein and a viral standard; Protein; 211 AA. 19-APR-1996; U05639, 20-APR-1995; US-426529. Cdn-1 cDNA was isolated from a human heart cDNA library using a previously isolated clone as probe. Recombinant Cdn-1 was produced in Sf9 and human colon adenocarcinoma HT29 cells. Expression of Cdn-1 in WI-LZ lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis.

N-PSDB; T17375.
Now isolated human Bcl-Y protein - used to develop prods. for
treating disorders characterised by inappropriate cell proliferation
or coll death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 3: Fig 4: 100pp; English.

Claim 3: Fig 4: 100pp; English.

Bel-Y protein (R81451) is a member of the Bel-2 family and can had early protein (R81451) is a member of the Bel-2 family and can funduce apoptosis in celis and function as a negative regulator of Bel-2 function. Bel-Y mRNA was detected in all human tumour cell insee examined and is also widely expressed in primary human tissues. It can be obte, by expression of a full-length CDNA clone (T1775) in pref. mammalian host cells. Bel-Y can be used to develop profes, for treating disorders associated with inappropriate cell proliferation or cell death, and to raise antibodies used for the diagnosis or monitoring of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0; Gaps

be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak-2 protein and a viral protein (e.g. EBV BRREI), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak-2 and viral proteins allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or

Cdn-2 cDNA was isold. from a human placental genomic library using a 950 bp fragment of Cdn-1 cDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Deletion of the N-terminal 59 amino acids of Cdn-1 only slightly decreased this activity, suggesting that small, truncated Cdn-1 sequence 152 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   autoimmune disease; reperfusion injury; hepatitis, osteoporosis; shock; lymphoma; eczema.

New poly-nucleotide encoding new poly-peptide(s) that modify apoptosis and related vectors, recombinant cells and antibodies, useful in assay and for control of cell death in e.g. neuronal cells, lymphocytes and cancers.

Claim 4: Page 87: 127pp: English.

This protein may be expressed recombinantly, particularly with pcmV plasmids as vectors for expression in mammalian cell cultures.

The protein has particular application in cancer cells (failure of programmed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 60 vvngatvhrsslevheivrasdvrgalrdagdefelryrrafsdltsglhitpgtaygsf 119

Nucleic acids encoding apoptosis regulating proteins - useful for diagnosing and treating immune disorders, malignancies, etc.
diagnosing and treating immune disorders, malignancies, etc.
Example 8; Page 34-35; 60pp; English.

The 80-6 mutant (W01020) of the bcl.-2 oncogene product (W01018) lacks amino acids 80-86 of the native protein. This and other Bcl.-2 mutants (see also W01019-21) were used in a two hybrid assay to examine the interactions between Bcl.-2 and novel apoptosisregulating proteins Nipl, Nip2 and Nip3 (W00997-99). 2 Motifs (W01003-04) on Bcl.-2 were identified that are essential for interaction with the Nip proteins. These motifs show homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W01020;

                                                                                   Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Deletion of the N-terminal 70 amino acids of Cdn-1 improved this activity, suggesting that small, truncated Cdn-1 molecules may be potent therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in Tarcassed cell survival in response to anti-Fas-mediated apoptosis. Iruncated Cdn-1 derivatives given in R77879-81 were used to test the effects of deleting the N-terminal sequences of Cdn-1 on this activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 rfvvdfmlhhciarwiaqrggwvaalnlgngpilnvlvvlgvvllgqfvvrrffks 116

Inducting or preventing death of T cells by bcl-XL protein regulation

Tursdup, increase survival of HIV infected cells or to

Gown:regulate immune responses in immune diseases

Disclosure; Page 52-53; 76pp; English.

This is the sequence of a human bcl.XL protein, which protects

T-lymphocytes against cell death. A splice variant form, bcl-XS,

acks a stretch of 63 amino acids, and is a dominant negative

regulator of bcl-XL function. The gene may be modified to

facilitate interaction with costimulatory Bax protein and inhibit

interaction with antagonistic Bad protein, by modification of the

Bcl-2 homology domains BHI and/or BH2. The bcl-XL gene may be

introduced into T-cells in vivo or ex vivo via gene transfer using

a vector for HIV infection gene therapy, to augment intracellular

bcl-XL protein levels and protect from cell death. A corresponding

antisense oligonuclectide or expression vector may be used in gene

therapy of e.g. autoimmune disease, graft rejection or graft-

corresponding in the interaction of the corresponding interaction or graft-

corresponding in the control may be used in gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Boise LH, Nunez G, Thompson CB;

WPI: 95-052079/07.

N-PSDB: 091698.

New poly-nucleotide encoding new poly-peptide(s) that modify apoptosis - and related vectors, recombinant cells and antibodies, useful in assay and for control of cell death in e.g. antibodies, useful in assay and cancers.

Claim 3: Page 94: 127pp; English.

C This protein may be expressed recombinantly, particularly with pcmV plasmids as vectors for expression in mammalian cell cultures. The programmed cell death (PCD)) or neurodegenerative and autoimmune classes (premature PCD), e.g. Parkinson's disease, amylotrophic lateral sclerosis and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   optosis; cell death; cancer; neurodegenerative disease; disease; Parkinson disease; amylotrophic lateral sclerosis;

Wethods for producing and identifying mutant bcl-2 proteins -
Methods for producing and identifying mutant bcl-2 proteins -
that lack death repressor activity and/or lacks binding to Bax.

By Disclosure; Page 40; 133pp; English.

The sequences given in R71404-05 represent the human bcl-2 alpha and
beta proteins respectively. bcl-2 is encoded by a proto-oncogene and
compares in hibiting apoptosis in many hematopoletic cell systems.
bcl-2 is a 26 kD membrane-associated cytoplasmic protein and is thought
co function by enhancing the survival of hematopoletic cells of B and T
corigins rather than directly promoting proliferation of these cell

concentrations of IL-3. bcl-2 has been shown to form hererodiners with
concentrations of IL-3. bcl-2 has been shown to form hererodiners with
concentrations of IL-3. bcl-2 has been shown to form hererodiners with
concentrations of IL-3. bcl-2 has been shown to form hererodiners with
concentrations of IL-3 bcl-2 and Bax determines cell survival or death
collowing an apoptotic stimulus. The invention gives a mutant form
collowing an apoptotic stimulus. The invention acid substitution or deletion
in the BHI or BH2 domains. This makes the mutant protein substantially
concentration of bcl-2 is useful in cancer therapy, controlling
concentration death effector molecules. Up regulating bcl-21s beneficial in
treatment and diagnosis of immunodeficiency diseases, including AIDS and
concentrative and ischaemic cell death.

Tilly, J.L.; Tilly, K.I.; Kenton, M.L.; Johnson, A.L. Endocrinology (1995) 136:232-241

Expression of members of the bcl-2 gene family in the immature rat ovary: equine chorionic gonadotropin-mediated inhibition of granulosa cell apoptosis is associated with decreased bax and constitutive bcl-2 and bcl-xlong messenger ribonucleic acid levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7

**SUBCELLULAR LOCATION.

**AEDLINE; 91066924.

A HOCKERBER D., WINDEZ G., MILLIMAN C., SCHREIBER R.D., KORSMEYER S.J.;

**NATURE 348:334-336(1990).

C -1- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF VARIOUS STIMULI INDUCING CELLULAR DEATH. BLOCKS APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDANT PATHWAY TO PREVENT APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDANT SUCH AS MITOCHONDRIA.

C -1- SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE.

C -1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES.

C -1- DISEASE: INVOLVED IN FOLLICULAR LYMPHOMA (FL) (ALSO KNOWN AS TYPE II CHRONIC LYMPHATIC LEUKEMIA) BY A CHROMSGOMAL TRANSLOCATION

C -1- DISEASE: MHICH INVOLVES BCLZ AND IMMUNOGLOBULIN GENE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 132 tvveelfrdgvnwgrivaffefggvmcvesvnremsplvdnialwmteylnrh-lhtwig 190

NUCLEIC ACIDS RES. 20:4187-4192(1992).

- 1- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF FREQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF FUNCTION IN AN ANTIOXIDANT PATHWAY TO PREVENT APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDANT PATHWAY TO PREVENT APOPTOSIS AT SITES OF PREE RADICAL GENERATION SUCH AS MITOCHONDRIAL.

-1- SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE.

-1- SISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES.

-1- ALTERNATIVE PRODUCTS: TWO FORMS OF BCL-2: ALPHA, AND BETA, ARE PRODUCED BY ALTERNATIVE SPLICING OF THE SAME GENE. THEY ONLY DIFFER AT THEIR C-TERMINAL ENDS.

-1- SIMILARITY: BELONGS TO THE BCL-2: FAMILY.

Presence of Vi-transposon-like elements in the proopiomelanocortin gene A of Xenopus laevis does not affect gene activity
Mol. Gen. Genet. 230 (3), 491-493 (1991) .; 7 Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata; Vertebrata; Amphibia; Batrachia; Anura; Mesobatrachia; Pipoidea; Pipidae; Xenopodinae; Xenopus. 1 (bases 1 to 9747) Deen,P.M.T. Comparative structural analysis of the transcriptionally active proopiomelanocortin genes A and B of Xenopus laevis Mol. Biol. Evol. 9 (3), 483-494 (1992) neuropeptide/opioid; opioid (beta-endorphin); POMC-A gene; preprohormone; proopiomelanocortin-A; repetitive element JH12; repetitive element Vi; secretion. Gaps 02-DEC-1993 colour adaptation; corticotrope (ATCH); melanotrope (a-MSH); Submitted (03-MAY-1991) P.M.T. Deen, Univ of Nijmegen, Toernnoolveld, 6525 ED Nijmegen, THE NETHERLANDS 2 (Dases I to 9747)
Deen, P.M.T., Terwel, D., Bussemakers, M.J.M., Roubos, E.W. and Martens, G.J.M.
Comparative analysis of the transcriptionally active Propolomelanocortin genes A and B of Xenopus laevis 4 (bases 1 to 9747) Deen, P.M., Bussemakers, M.J., Terwel, D., Roubos, E.W. and Martens, G.J. .; ;

PT Screening for anti-viral agents - by detecting the ability of an expect to disrupt the interaction of a Bak protein and a viral protein. PT agent to disrupt the interaction of a Bak protein and a viral protein. PT protein. PS Disclosure; Fig 2; 24pp; English. CC The sequence encodes Bak-2 protein, which is a bcl-1 homologue which interacts with Epstein-Bair virus (EBV) early lytic cycle BhRF1 protein, and is capable of modulating apoptosis. The Bak-2 gene is complete or partial form, or as an epitope tag fusion protein, in a ccomplete or partial form, or as an epitope tag fusion protein, in a complete or partial form, or as an epitope tag fusion protein, in a ccomplete or partial form, or as an epitope tag fusion protein, in a ccomplete or partial form, or as an epitope tag fusion protein, in a ccomplete or partial form, or as an epitope tag fusion protein, of Bak-2 protein and a viral protein (e.g. EBV BHRPI), exposure to a test compound, and monitoring for disruption of the interaction, cc e.g. by co-precipitation, protein interactive trapping or ELISA. CC Interaction of Bak-2 and viral proteins allows viral replication or

Claim 6, Fig. 5A-H; 66pp; English.

Claim 6, Fig. 5A-H; 66pp; English.

Can-2 cDNA was isolated from a human placental genomic library using a 950 bp fragment of Cdn-1 cDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

The sequence encodes Bak protein, which is a bcl-1 homologue which
The sequence encodes Bak protein, which is a bcl-1 homologue which
The sequence encodes Bak protein, which is all live carly lytic cycle BHREI
The protein, and is capable of modulating apoptosis. The Bak gene is
Located on human chromosome 6 at 6p21-23. The protein may be used
in complete or partial form, or as an epitope tag fusion protein,
In a new virucide drug screening method, which involves combination
of Bak protein and a viral protein (e.g. EBV BHREI), exposure to a
test compound, and monitoring for disruption of the interaction,
Ce.g. by co-precipitation, protein interactive trapping or ELISA.
Interaction of Bak and viral proteins allows viral replication or
Interaction may be used as virucide, antitumour or diagnostic agents.
